ESCALLONIA

Escallonias are tough, quick maturing, hardy shrubs which respond favourably to trimming. This with their tolerance of salt wind makes them ideal for hedging. With informal hedges trim immediately after flowering, to have a spectacular display the following year.

Escallonia x Exoniensis (White Profusion)

Also known as 'White Profusion'. A vigorous hardy shrub with white, sometimes blush pink flowers in summer. This is the popular white form used in hedging. Ht. 2m. Evergreen.

A tough hardy group of popular herbaceous perennials. All grow well in good moist well drained soils with light shade. Most have relatively small juvenile leaves when first planted but after several years develop handsome bold foliage through summer with spikes of attractive summer flowers. They form great ground covers for shaded borders (south side of buildings) or under trees, making for an easy care garden. There is a huge range of size and colour foliage no wonder in recent years there has been a great upsurge in their use and many new forms have been introduced.

HYDRANGEA

A rewarding group of shrubs at their best when most others have finished for the year. The very popular H.macrophylla (H. hortensia) has very attractive heads of flowers from mid summer to autumn. They are divided into two groups - those with mop heads (round ball heads of flowers), and lacecaps (a flat head of flowers with the spectacular large flowers as a ring around the edge of the head) The flower colour may be: creamy white, pink - red, or pale blue - deep violet blue. It is most unusual in that pink or blue flowers are controlled by the availability of aluminium in the soil. Acid soils and aluminium sulphate gives blue flowers. Sweet, alkaline soils and no aluminium gives pink - red flowers. Flower size may also be dramatically improved by a good, well drained moist fertile soil, giving the best results. Pruning should be done each year in the spring and restricted to removing dead and weak wood right out at the base of the plant. Also some thinning maybe necessary to allow room for new water shoots to come through from the base each year. Do not trim the top back, as the flowerbuds were formed the previous summer/autumn. H.macrophylla should be protected from the worst of the winter frosts, this is why the deadheads should be retained until spring. I find the H.arborescens and H.paniculata forms much tougher to winter cold. They may be pruned in late winter or very early spring, as flower buds do not form until this time.

Rhododendron

Rhododendrons are indispensable for spring colour in any garden. There is a huge range of colours, sizes and shapes to choose from. They all prefer an acid free draining organic moist soil. In a position sheltered from the worst wind and hottest sun. I find they do best in a mixed boarder with a few trees dotted through e.g.. Maples magnolias, apples or dogwoods which contrast nicely.
