**HYDRANGEA**

A rewarding group of shrubs at their best when most others have finished for the year. The very popular *H. macrophylla* (*H. hortensia*) has very attractive heads of flowers from mid summer to autumn. They are divided into two groups - those with mop heads (round ball heads of flowers), and lacecaps (a flat head of flowers with the spectacular large flowers as a ring around the edge of the head) The flower colour may be: creamy white, pink - red, or pale blue - deep violet blue. It is most unusual in that pink or blue flowers are controlled by the availability of aluminium in the soil. Acid soils and aluminium sulphate gives blue flowers. Sweet, alkaline soils and no aluminium gives pink - red flowers. Flower size may also be dramatically improved by a good, well drained moist fertile soil, giving the best results. Pruning should be done each year in the spring and restricted to removing dead and weak wood right out at the base of the plant. Also some thinning maybe necessary to allow room for new water shoots to come through from the base each year. Do not trim the top back, as the flowerbuds were formed the previous summer/autumn. *H. macrophylla* should be protected from the worst of the winter frosts, this is why the deadheads should be retained until spring. I find the *H. arborescens* and *H. paniculata* forms much tougher to winter cold. They may be pruned in late winter or very early spring, as flower buds do not form until this time.

**Pieris****Lily of the Valley Bush**

This close relative of the Rhododendron requires the same conditions, and is used in the landscape in the same way. However the panicals of mainly white flowers are very distinct, and very ornamental as is the foliage, especially when in full new growth in the late spring. As with rhodos it is important to deadhead after flowering. I leave this until early November when all fear of frost is over. This delays the vulnerable new growth. To control weeds near the plants, mulch with pea straw/peat and bark mix/pine duff. This feeds the plant and keeps the roots cool and moist.
